Thesis

MSc in Informatics Engineering

Entermediate Report

Evaluate the robustness of Cloud

Gonçalo Silva Pereira

Supervisor	Raul Barbosa
Co-Supervisor	Henrique Madeira

Department of Informatics Engineering University of Coimbra February 13, 2015

Dedication

Acknowledgements

I would like to thank to —— and to professors Raul Barbosa and Henrique Madeira, who are role models, by their support and help to take good decisions.

Thank my girlfriend for their support, understanding and the fellowship along this path. At my friends and colleagues of Department of Informatics Engineering the patience, support and for all times they have given me.

Last but certainly not least, I would like to thank my family for encouragement, love and all the unconditional and constant support that led me to fulfill this dream. Obrigado!

Gonçalo Silva Pereira

Abstract

Inject faults in code of applications, compile them and evaluate the results.

The theme of the dissertation is "Evaluate the robustness of Cloud".

This thesis/dissertation presents an ?????

Keywords: Faults, Errors, Failures, Vulnerabilities, Fault Injection, Fault Tolerance, Security, Robustness.

1 Introduction

1.1 Contextualization

The present dissertation describes the work developed in scope of MSc in Informatics Engineering. It is focused in "Evaluate the robusteness of Cloud" and this is one subject very important nowadays, because of the increase usage of these services. This services are characterized by the placement of data and software on remote infrastructure. Despite of the numerous benefits, the reliability of these platforms has not kept the needs, and users trust their applications to systems outside of personal control.

In this context, naturally arises the problem of confidence in the entity that manages the platform where applications have been executed. Any organization that put an application in the cloud (for example, Microsoft Azure or Amazon EC2) will have to accept the assurances given by the service provider.

This internship deals with the challenge of assessing the robustness of cloud platforms. The computing service provider uses virtualization to manage and allocate computing power to meet actual needs of the application. Although, there are solid virtualization platforms, fault tolerance is still a research problem.

1.2 The project

This project is based essentially in inject software faults. It was decided to inject software faults, since there are already other people involved in the part of hardware faults.

1.3 Objectives

The main objective of this work is to build a tool to inject software faults in code of some programs before the compilation.

But this main objective is divided in some other goals:

- Generate derivations of main code of selected programs;
- Verify and analyze the effect of produced faults;
- Compile the programs with injected faults, by using make file.

1.4 Document Structure

This document is ...
In the second section ...
In the third section ...
Finally, in last section ...

1.5 Management

In this section is described the planning of work developed in stage.

1.5.1 Meetings

In relation a meetings, the supervisor Raul Barbosa and me agreed that meet weekly was the best option. And the meetings were going on, with one or another change of schedule to reconcile with the other activities of both. In addition, I went to several general meeting of the project. Where could discuss concepts and the direction of the project with colleagues and teachers, among them: Raul Barbosa (supervisor), Henrique Madeira (co-supervisor), João Durães and João André Ferro.

1.5.2 Risks

The main-risks of execution of this project are:

- Equipment Failure
- Data lost
- Publication of similar research
- Personal issues interfere with progress
- Student loses interest
- Dispute between student and supervisor
- Supervisor takes excessive time to check final drafts
- Student wants to submit thesis without supervisor approval

The preventative measures and recovery measures can be seen at Appendix C.

1.5.3 Planning and Tracking

In Appendix A, is presented the gantt with the planning tasks to first and to second semester.

I have prioritized the tasks using the nomenclature in Table 1:

Classification	Mean
Must	Must be implement at project finish,
Wiast	and his implementation is priority.
Nice	May be part of the functionality implemented
Nice	at the end of project, and his implementation is optional.
Wich fail	It's specified but his implementation is
Wishful	not expected until the end of project.

Table 1: Classification of requirements

About the development of this project, I have used an $Agile\ Life\ Cycle$ based in a $Incremental\ Model$.

What is the requirements of this project???

2 State of the Art

Nowadays, people use lot's of services based in cloud and lot's of companies choose to use them too. Using it, companies reduce the costs of IT infrastructure and people don't buy "physical storage" and don't care where are the data. The cloud service provide that the data is secure. But, like any system, the cloud have problems such as another computer systems, software and hardware faults. And the resilience of the cloud is an important characteristic.

The increased use of cloud is related with a low usage of many dedicated servers, lower voltage levels, reduce noise margins and increase clock rates [1].

The cloud providers offers resources ready to deliver [1].

With this work, I want to inject software faults and analyze how the system react to them.

A lot of studies show that the software faults it's the main cause of computer failures.

In this work deliberate how

I had access to the application of Robert Natella, called SAFE, that inject software faults, as I also have to do.

[2] [3]

About 44% of the software faults cannot be emulated [4].

3 Research objectives and approach method

3.1 GCC Parser vs CDT Parser vs Bison

3.2 Cloud Computing

Three levels of Cloud Computing:

- Infrastructure-as-a-Service (IaaS);
- Platform-as-a-Service (PaaS);
- Software-as-a-Service (SaaS).

The cloud computing isn't free of external disturbances[1], the most importants are:

- Security attacks;
- Accidents;
- Power surges;
- Workload faults;
- Malfunction;
- Worms
- Distributed Denial of Service (DDOS) attacks.

3.3 Applications to inject faults

4 Current work and preliminary results

5 Work plan and implications

Built three separated modules:

- Generate the derivations of main code of selected programs;
- Verify and analyze the effect of produced faults;
- Compile the programs with injected faults, by using make file.

5.1 Generate derivations

I chose to use the most representative faults [2], divided into missing, wrong and extraneous, specified individually further down:

5.1.1 Fault Types - Missing:

- MIFS if construct plus statements
- MLAC AND sub-expr in expression used as branch condition
- MFC function call
- MIA if construct around statements
- MLOC OR sub-expr in expression used as branch condition
- MLPA small and localized part of the algorithm
- MVAE variable assignment using an expression
- MFCT functionality
- MVAV variable assignment using an value
- MIEB if construct plus statements plus else before statements
- MVIV variable initialization

5.1.2 Fault Types - Wrong:

- WLEC logical expression used as branch condition
- WALL algorithm large modifications
- WVAV value assigned to variable
- WAEP arithmetic expression in parameter of function call
- WSUT data types or conversion used
- WPFV variable used in parameter of function call

5.1.3 Fault Types - Extraneous:

• EVAV - variable assignment using another variable

5.2 Analyze the effects

The fault injected results is equal to the real software faults?

5.3 Compile programs

Select five to ten programs to test.

6 Conclusion

6.1 Global Vision

Global Vision

6.2 Future Work

Future Work

A Appendix A - Gantt diagrams

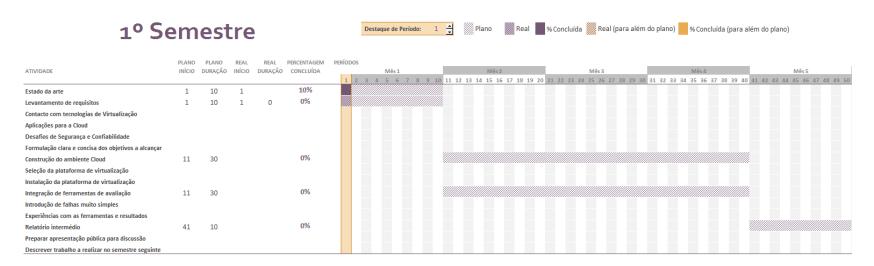

Figure 1: First semester gantt.

Figure 2: Second semester gantt.

B Appendix B - Risks table

Risc Area	Preventative Measures	Recovery Measures	
	Ensure regular maintenance is undertaken		
Equipment Failure	Allow for sufficient funding for repairs	Use alternative sources/type of equipment as	
	Indentify alternative sources/type of equipment	a ppropria te	
Data lost	Back-up data regularly		
	Regularly search electronic publications databases	Modify project	
Publication of similar research	Continue literature review throughout candidature		
	Ensure timely submission		
	Take leave of absence (unless for sickness or bereavement)		
Personal issues interfere with progress	Take annual leave	Re-apply for admission when able to commit	
r ersonarissoes interiere with progress	Take sick leave	ke-apply for admission when able to commit	
	Communicate with supervisor		
	Select motivating topic at the start		
	Enrolling area ensures a dynamic research culture		
Student loses interest	Improve communication between student and supervisor		
Student loses interest	Look for warning signs		
	Register for support programs/seminars		
	Talk to fellow students in research area		
Discuss between students and consentence	Understand each other's roles and expectations		
Dispute between student and supervisor	Agree on dispute resolution process when initiating relationship		
	Supervisor to plan out workload		
Supervisor takes excessive time to check final drafts	Student plan ahead to ensure supervisor will be available		
uidis	Student/Supervisor to review chapters/sections at regular intervals		
Student wants to submit thesis without supervisor	Student to be counselled regarding implications - a recomendation of fail	Review of thesis by alternative person within	
approval	or major revision from examiners likely if thesis below standard	University recommended
